DRAM 256 K x 16 DRAM
EDO PAGE MODE

FEATURES

- X16 organization
- EDO (Extended Data-Output) access mode
- 2 $\overline{CAS}$ Byte/Word Read/Write operation
- Single 5V (± 10%) power supply
- TTL-compatible inputs and outputs
- 512-cycle refresh in 8ms
- Refresh modes : $\overline{RAS}$ only, $\overline{CAS}$ BEFORE $\overline{RAS}$ (CBR) and HIDDEN
- JEDEC standard pinout
- Key AC Parameter

	t_{RAC}	t_{CAC}	t_{RC}	t_{PC}

GENERAL DESCRIPTION

The M11B416256A is a randomly accessed solid state memory, organized as 262,144 x 16 bits device. It offers Extended Data-Output , 5V(± 10%) single power supply. Access time (-25,-28,-30,-35,-40) and package type (SOJ, TSOP II) are optional features of this family. All these family have $\overline{CAS}$ - before - $\overline{RAS}$, $\overline{RAS}$ -only refresh and Hidden refresh capabilities.

Two access modes are supported by this device : Byte access and Word access. Use only one of the two $\overline{CAS}$ and leave the other staying high will result in a BYTE access. WORD access happens when two $\overline{CAS}$ ($\overline{CASL}$, $\overline{CASH}$) are used. $\overline{CASL}$ transiting low during READ or WRITE cycle will output or input data into the lower byte (IO0~IO7), and $\overline{CASH}$ transiting low will output or input data into the upper byte (IO8~15).

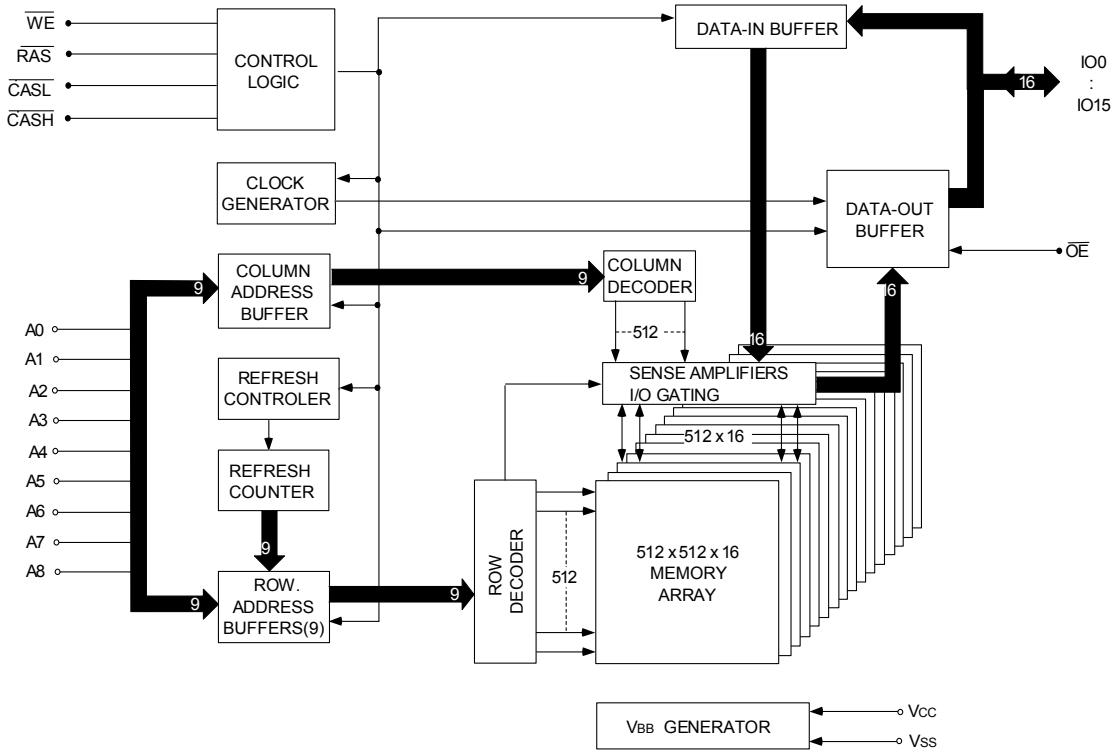
FUNCTIONAL BLOCK DIAGRAM



PIN DESCRIPTIONS

PIN NO.	PIN NAME	TYPE	DESCRIPTION
16~19,22~26	A0~A8	Input	Address Input Row Address : A0~A8 Column Address : A0~A8
14	$\overline{RAS}$	Input	Row Address Strobe
28	$\overline{CASH}$	Input	Column Address Strobe / Upper Byte Control
29	$\overline{CASL}$	Input	Column Address Strobe / Lower Byte Control
13	$\overline{WE}$	Input	Write Enable
27	$\overline{OE}$	Input	Output Enable
2~5,7~10,31~34,36~39	I/O0 ~ I/O15	Input / Output	Data Input / Output
1,6,20	V_{CC}	Supply	Power, 5V
21,35,40	V_{SS}	Ground	Ground
11,12,15,30	NC	-	No Connect

ABSOLUTE MAXIMUM RATINGS

Voltage on Any pin Relative to Vss … ……-1V to +7V
Operating Temperature, T_A (ambient) ….0 °C to +70 °C
Storage Temperature (plastic) …….-55 °C to +150 °C
Power Dissipation ……1.43W
Short Circuit Output Current ……50mA

Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded. This is a stress rating only, and functional operation of the device above those conditions indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC ELECTRICAL CHARACTERISTICS AND RECOMMENDED OPERATING CONDITIONS ($0\,°C \le T_A \le 70\,°C$; $V_{CC} = 5V \pm 10\%$ unless otherwise noted)

PARAMETER	CONDITIONS	SYMBOL	MIN	MAX	UNITS	NOTES
Supply Voltage		V_{CC}	4.5	5.5	V	1
Supply Voltage		V_{SS}	0	0	V	
Input High Voltage		V_{IH}	2.4	V_{CC} +0.3	V	1
Input Low Voltage		V_{IL}	-0.3	0.8	V	1
Input Leakage Current	$0V \le V_{IN} \le V_{IH}$ (max)	I_{LI}	-10	10	μ A	
Output Leakage Current	$0V \le V_{OUT} \le V_{CC}$ Output(s) disable	I_{LO}	-10	10	μ A	
Output High Voltage	I_{OH} = -5 mA	V_{OH}	2.4	-	V	
Output Low Voltage	I_{OL} = 4.2 mA	V_{OL}	-	0.4	V	

Note : 1.All Voltages referenced to V_{SS}

Notes :

1. Enables on-chip refresh and address counters.
2. V_{IH}(min) and V_{IL}(max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL}.
3. In addition to meet the transition rate specification, all input signals must transit between V_{IH} and V_{IL} in a monotonic manner.
4. Assume that $t_{RCD} < t_{RCD}$(max). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.
5. Assume that $t_{RCD} \geq t_{RCD}$ (max)
6. If $\overline{CAS}$ is low at the falling edge of $\overline{RAS}$, data-out will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, $\overline{CAS}$ and $\overline{RAS}$ must be pulsed high.
7. Operation within the t_{RCD} limit ensures that t_{RCD} (max) can be met, t_{RCD} (max) is specified as a reference point only ; if t_{RCD} is greater than the specified t_{RCD} (max) limit, access time is controlled by t_{CAC}.
8. Operation within the t_{RAD} limit ensures that t_{RAD}(max) can be met. t_{RAD}(max) is specified as a reference point only ; if t_{RAD} is greater than the specified t_{RAD} (max) limit, access time is controlled by t_{AA}.
9. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
10. t_{OFF1}(max) defines the time at which the output achieves the open circuit condition ; it is not a reference to V_{OH} or V_{OL}.
11. t_{WCS}, t_{RWD}, t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If $t_{WCS} \geq t_{WCS(min)}$, the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $t_{RWD} \geq t_{RWD(min)}$, $t_{AWD} \geq t_{AWD(min)}$ and $t_{CWD} \geq t_{CWD(min)}$, the cycle is READ-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{CAS}$ and $\overline{RAS}$ or $\overline{OE}$ go back to V_{IH}) is indeterminate. $\overline{OE}$ held high and $\overline{WE}$ taken low after $\overline{CAS}$ goes low result in a LATE WRITE ($\overline{OE}$ -controlled) cycle.
12. Those parameters are referenced to $\overline{CAS}$ leading edge in EARLY WRITE cycles and $\overline{WE}$ leading edge in LATE WRITE or READ-MODIFY- WRITE cycles.
13. During a READ cycle, if $\overline{OE}$ is low then taken HIGH before $\overline{CAS}$ goes high, I/O goes open, if $\overline{OE}$ is tied permanently low, a LATE WRITE or READ-MODIFY-WRITE operation is not possible.
14. An initial pause of 200μs is required after power-up followed by eight $\overline{RAS}$ refresh cycles ($\overline{RAS}$ only or CBR) before proper device operation is assured. The eight $\overline{RAS}$ cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
15. WRITE command is defined as $\overline{WE}$ going low.
16. LATE WRITE and READ-MODIFY-WRITE cycles must have both tOFF2 and t_{OEH} met ($\overline{OE}$ high during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycles.
17. The I/Os open during READ cycles once t_{OFF1} or t_{OFF2} occur.
18. Referenced to the earlier $\overline{CAS}$ falling edge.
19. Referenced to the latter $\overline{CAS}$ rising edge.
20. Output parameter (I/O) is referenced to corresponding $\overline{CAS}$ input, IO0~7 by $\overline{CASL}$ and IO8~15 by $\overline{CASH}$.
21. Last falling $\overline{CAS}$ edge to first rising $\overline{CAS}$ edge.
22. Last rising $\overline{CAS}$ edge to next cycle's last rising $\overline{CAS}$ edge.
23. Last rising $\overline{CAS}$ edge to first falling $\overline{CAS}$ edge.
24. Each $\overline{CAS}$ must meet minimum pulse width.
25. Referenced to the latter $\overline{CAS}$ falling edge.
26. All IOs controlled by $\overline{OE}$, regardless $\overline{CASL}$ and $\overline{CASH}$.

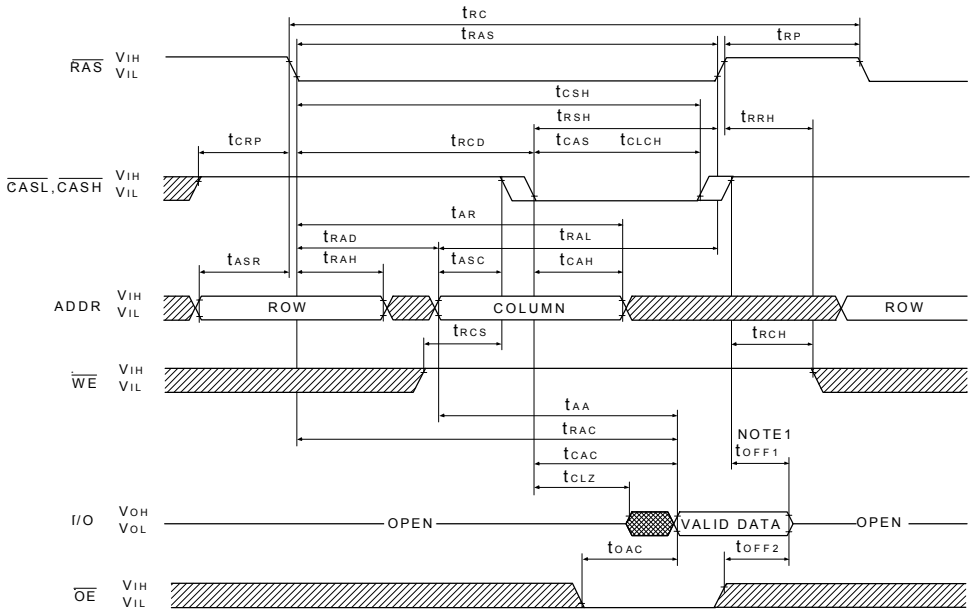
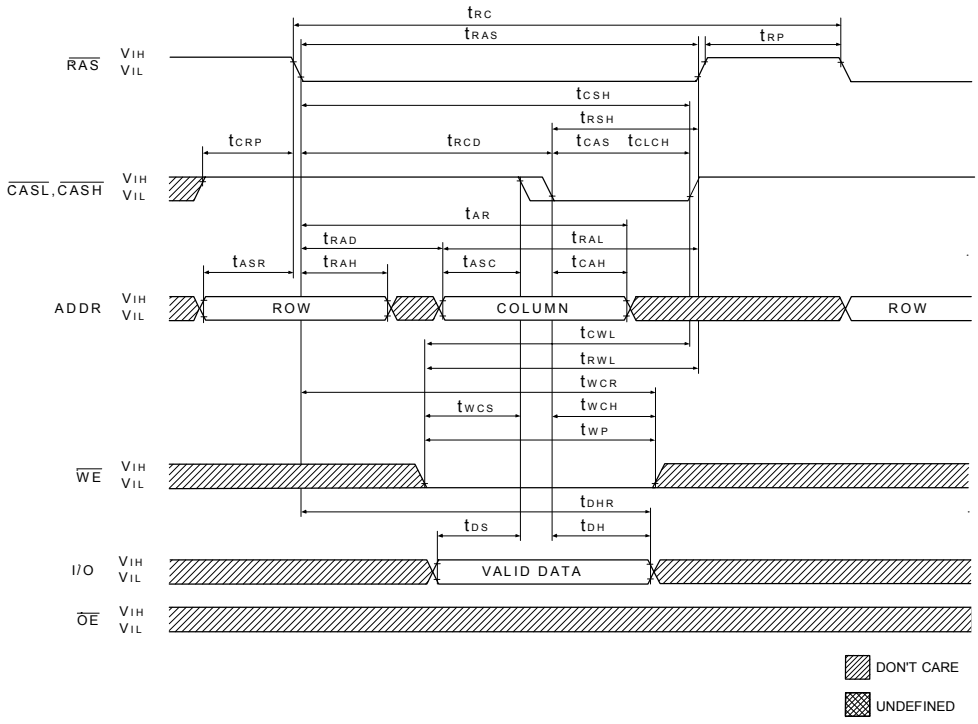
*Note : 1. These WRITE cycles may also be BYTE WRITE cycles (either $\overline{CASL}$ or $\overline{CASH}$ active).
2. These READ cycles may also be BYTE READ cycles (either $\overline{CASL}$ or $\overline{CASH}$ active).
3. Only one $\overline{CAS}$ must be active ($\overline{CASL}$ or $\overline{CASH}$).

READ CYCLE

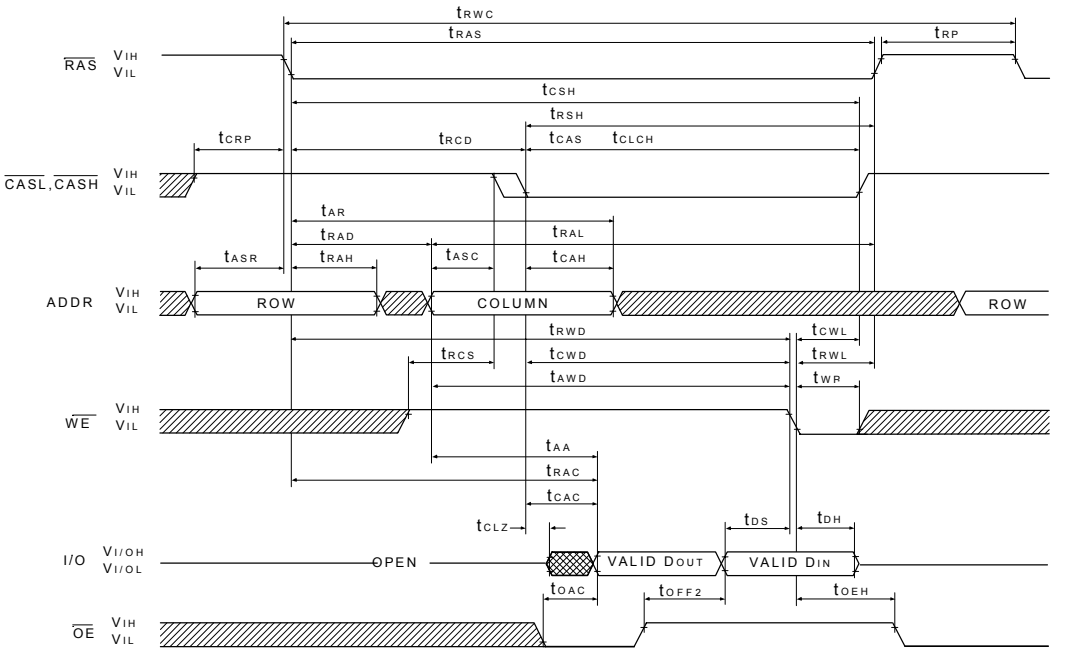


EARLY WRITE CYCLE

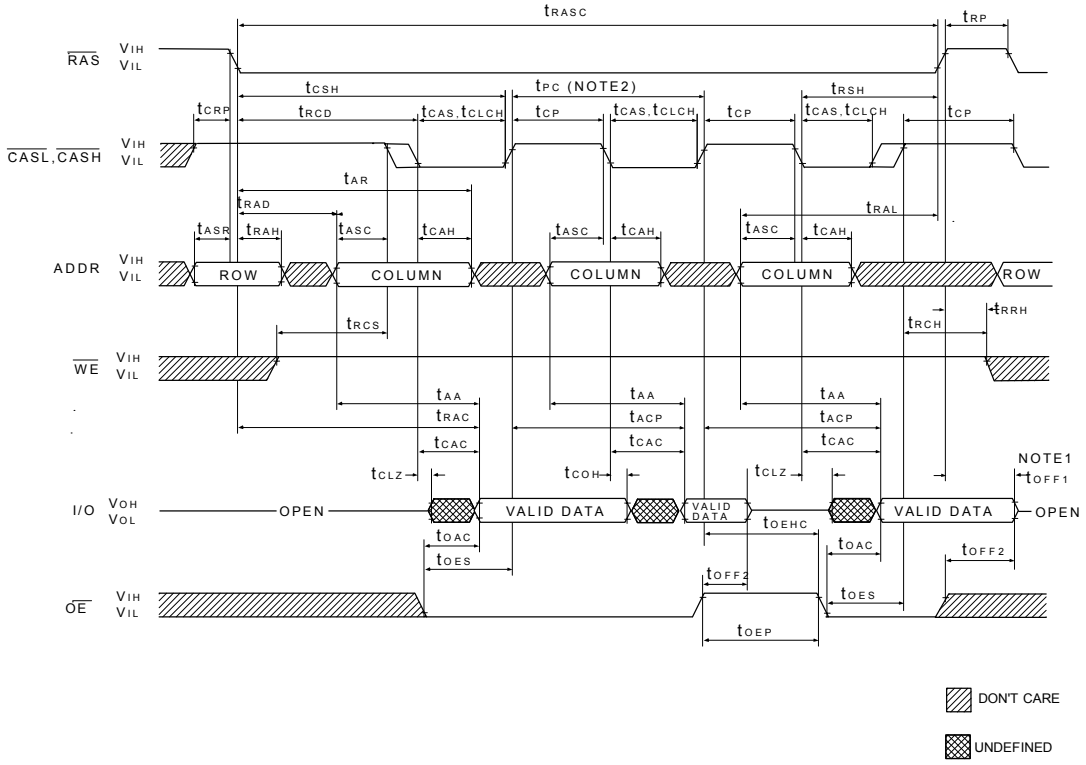


Note: 1. t_{OFF1} is referenced from the rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

READ WRITE CYCLE
(LATE WRITE and READ-MODIFY-WRITE CYCLES)



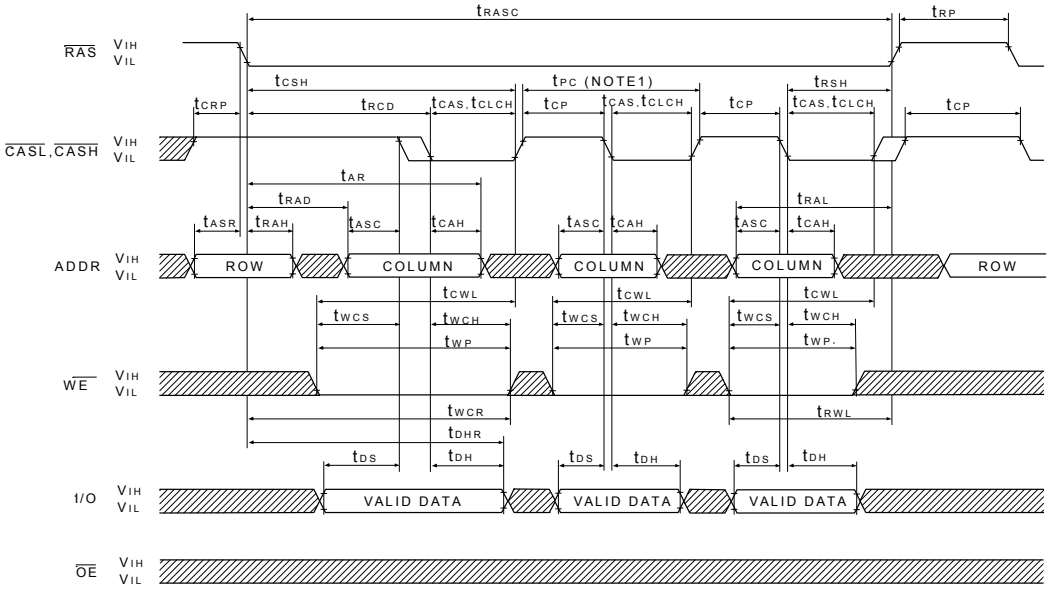
EDO-PAGE-MODE READ CYCLE



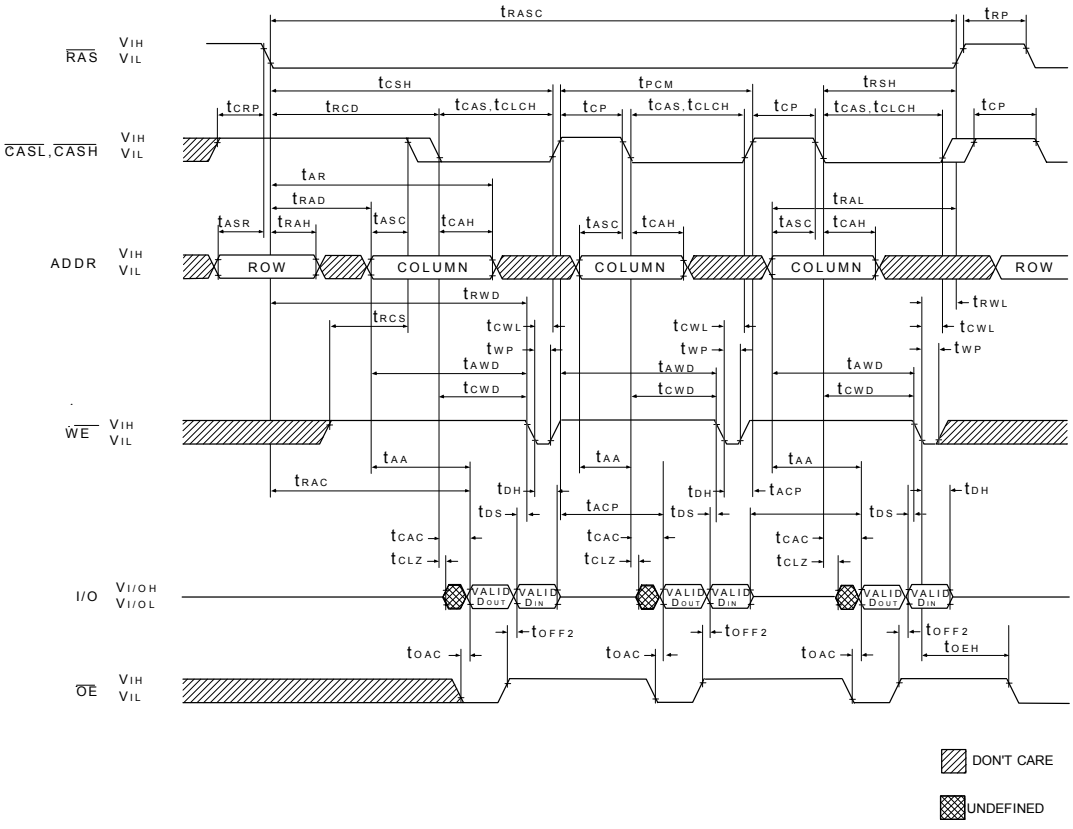
*NOTE : 1. t_{OFF1} is referenced from the rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

2. t_{PC} can be measured from falling edge of $\overline{CAS}$ to falling edge of $\overline{CAS}$, or from rising edge of $\overline{CAS}$ to rising edge of $\overline{CAS}$. Both measurements must meet the t_{PC} specification.

EDO-PAGE-MODE EARLY-WRITE CYCLE

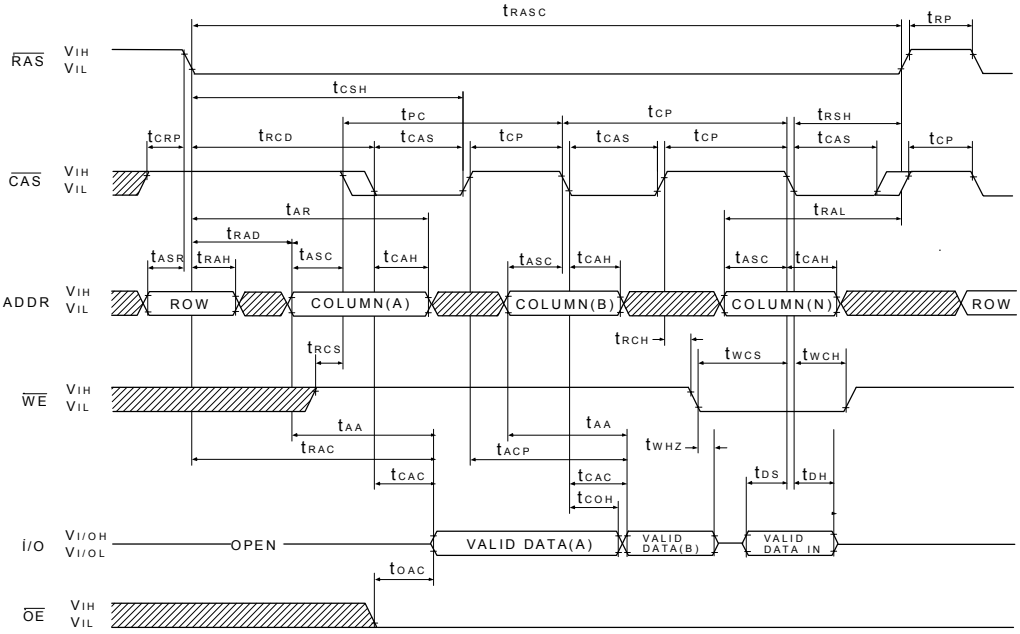


EDO-PAGE-MODE READ-WRITE CYCLE
(LATE WRITE and READ-MODIFY-WRITE CYCLES)

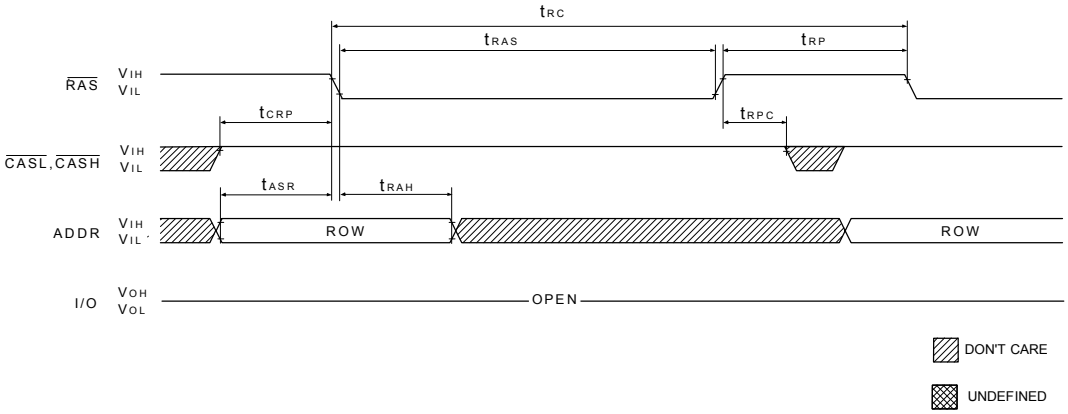


Note : 1. t_{PC} can be measured from falling edge to falling edge of $\overline{CAS}$, or from rising edge to rising edge of $\overline{CAS}$. Both measurements must meet the t_{PC} specification.

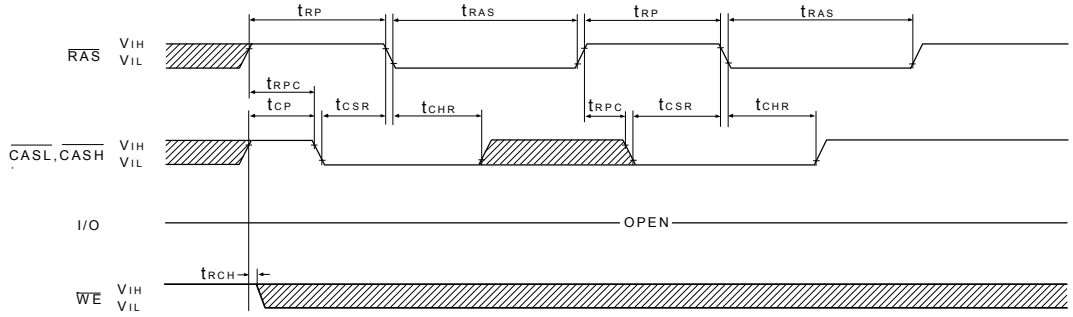
EDO-PAGE-MODE READ-EARLY-WRITE CYCLE
(Psuedo READ-MODIFY-WRITE)



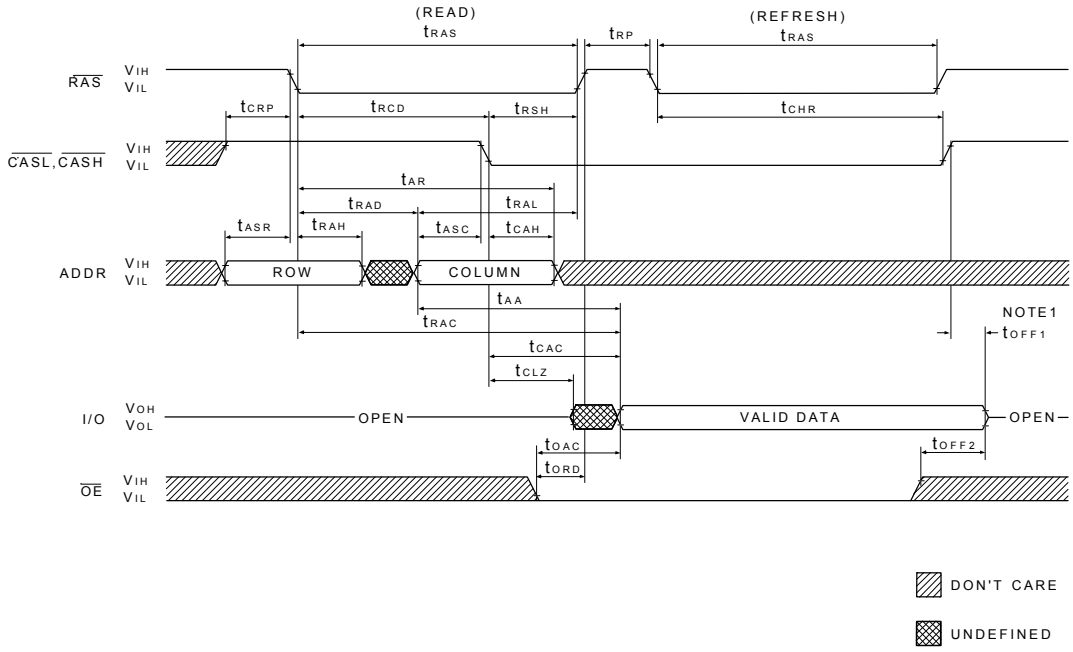
RAS ONLY REFRESH CYCLE
(ADDR = A0~A8 ; OE , WE = DON'T CARE)



CBR REFRESH CYCLE
(A0~A8 ; $\overline{OE}$ = DON'T CARE)



HIDDEN REFRESH CYCLE
($\overline{WE}$ = HIGH ; $\overline{OE}$ = LOW)



Note : 1. t_{OFF1} is reference from the rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.
